

Fast Attack

Fast Attack is sold in a sealed 8oz bottle as a concentrate. One bottle is poured into a 2 1/2 gallon pump up sprayer and then filled with 2 1/2 gallons of water.

Once product is mixed with water, it is ready to be sprayed onto surfaces for sanitizing.

For condensate pans which contain slime and other microbial matter, it is desirable to wet-vac out as much debris as possible. Then spray on the concentrate.

Air handler cooling or heating coils can also be sprayed with Fast Attack prior to and after cleaning with a standard alkaline cleaner.

As with any chemical, users should wear protective gear such as gloves, goggles and a mask if necessary.

Fast Attack must be used per directions on the bottle. A standard contact time of 10 minutes is directed. Although Fast Attack need not be rinsed after the 10 minute contact period, we recommend rinsing at this point.

We recommend that any time chemicals of any sort are used within an AHU, the unit is shut down, that is the fans are turned off. Of course, as stated, we recommend that the inlet and outlet plenums be sealed off as well under certain use circumstances.
